Python Workout Tracker Structure

You

I'm working on a CS project that requires me to build a Python drafter program. I want to create a workout tracker that allows a user to log workouts (sets, reps each set (according to number of sets, weight) and also allows a user to modify existing workout names and then view progression across a workout exercise by using matplotlib. Please write me a program using the following requirements and technical direction that I've brainstormed already:

-At least 7 route functions, what I've come up with (feel free to change if necessary): (Index, View_exercises, Add_exercise, Remove_exercise, Progress_graph, Clear_graph, Settings_page)

-At least 5 Pages, what I've come up with (feel free to change if necessary): Main Menu, Edit Exercises, Log Exercises, View Progression, Settings

-State Dataclass with at least 4 fields, what I've come up with (change if needed): Exercises: list[Exercise], History: list[int], Streak: int (how many workouts user has done, maybe displayed at top of page), Filter: str

-a Second dataclass, Exercises with fields: Name: str, Muscle_group: str, Sets: int, Reps: int, Weight: int

-At least 3 user inputs -> WeightLifted -> textbox, Sets -> Selectbox, Muscle Group -> SelectBox (in edit exercises), Website Theme: checkbox (settings menu, dark/light theme)

-At least 3 If Statements -> check if the textbox for exercise name is blank when a user creates a new exercise or edits a previous one ; Max weight -> this checks if your current logged weight is greater than your highest ever logged weight and displays that as your max

weight when you select that exercise. ; Max weight -> this checks if your current logged weight is greater than your highest ever logged weight and displays that as your max weight when you select that exercise. (Add more if necessary or change if deemed unnecessary)

-At least 1 loop -> iterate over the history list in the State dataclass to grab weights for one particular exercise to be graphed (change if not needed or more if needed)

-Site cannot have global variables but global constants are okay

-Must have thorough code documentation

Again, make changes if needed because my outline may not be 100% sufficient.

I have some complaints/bugs. The dark mode doesnt do anything in settings. Also, you are allowed to enter a negative number for reps/sets. And even if you select 2 sets under the dropdown, it still shows all the other textboxes for the sets.

Send the updated code.

ChatGPT

You

Okay, the sets drop down is better but itstill allows you to enter negative numbers. Also dark mode makes everything black but the text is still black, so make that more visible. Send the updated code

You

So I enabled dark mode. I went into the log workout and changed the number of sets. And the website reverted to light mode. Can you fix that and send the updated code/

Ensure that every function has types (paraamters, return values) and also

- Add `set_site_information(...)` right before `start_server()` in your main Python file

Is there a way to save data to the device? Like workout data so users can access progressions even if they quit the program

ChatGPT

You

Here are some errors I've encountered on GitHub, can you fix the code so my code goes through error-free?

1. Lines 279 & 282: List Type Inference (`expected "Header"`)

- **Why it happens:** When you create a list starting with a `Header` (for example, `content = [Header("...")]`), `mypy` assumes that list can **only** ever hold `Header` objects. When you later try to `.append()` a `str` (line 279) or a `TextBox` (line 282), `mypy` rejects them.
- **How to fix it:** Give the list a broader type annotation when you create it so it can hold any Drafter component or string. Import `PageContent` from `drafter` (or use `list[Any]`):

2. Line 640: Passing a List to `Output` (`expected "str"`)

- **Why it happens:** On line 640, you are creating an `Output("name", value)` component where the second argument (`value`) is a `list` instead of a `str`. Drafter's `Output` expects a string.
- **How to fix it:** Convert the list into a single string before passing it to `Output` (for example, using `", ".join(...)` or `str(...)`), or display the list using `BulletedList(...)` / `NumberedList(...)` instead of `Output`.
